

# iCONNECT | in-wall docking station for iPod integration

## iPod music and video made simple!

iCONNECT lets you view your latest photos and internet videos on your flat screen, or enjoy your favorite music through your home stereo speakers or whole house entertainment system. iCONNECT charges your iPod while it sits in the wall and hides those messy wires and plugs.

### Benefits:

- Dock and charge your iPod
- Sleek recessed housing hides unsightly wires
- Change tracks from a distance with a simple IR remote
- Share your photos and videos with friends and family on your flat panel display
- Integrate your iPod with almost any home stereo or whole house music system
- Compatible with EPI Smart Home Touch Panel solution
- Control your iPod from your TV display \*available first quarter 2008
- Integrates with the iPod, iPod with color display, iPod with video, iPod mini, iPod nano
- Options for desktop - free standing units
- Available in white or black

*\*Price does not include iPod, flat panel display, home stereo, music entertainment system, or smart home touch panel. Price does not include connection to client equipment. iCONNECT to be wired to Grand room unless we are directed otherwise. Price is subject to change without notice.*

# iCONNECT | tech talk

iCONNECT housing

iCONNECT system converts an unbalanced audio signal from your iPod to balanced audio, which is then transmitted over cat5e cables to the Great Room A/V wall jack location. (Balanced signals are much better for long cable runs due to their ability to reject induced noises through a technology known as Common Mode Rejection.)

Wall plate balanced audio receivers convert balanced signal back to unbalanced audio through the wall plate electronics. Simply plug your stereo receiver or entertainment system into the wall jack and the remotely located iPod becomes a source which you can enjoy in the Great room or any where in the house where you have connected amplification and speakers.

Bedroom

By having multiple iCONNECT's throughout the home, you can switch between them while they are docked. Simply plug them into the back of the receiver or entertainment system. Most multi-room audio systems have 6 or more inputs

A simple to use remote is included with each iCONNECT which, when pointed at the iCONNECT housing, will control basic iPod functions including Play/Pause, Next Song, and Previous Song. More control commands are available dependant on the iPod model you are using.

Additional options include a balanced video wall plate which allows you to view video content from your iPod on a connected TV with a composite (yellow) input. A future upgrade (1st quarter 2008) will allow you to control your iPod using the television to display your music content and a simple remote to navigate your display. (Pricing not yet determined)

Finally an advanced control upgrade is available which provides control and meta data information via the RS-232 protocol. RS-232 provides seamless integration with more powerful entertainment systems allowing you to control individual iCONNECT's and display meta data such as artist, album, track, genre and play list information on touch-panels and route audio content to individual rooms.
